## Problem Set 2

1.  $\mathcal{P}$  is not consistent.

*Proof.* For any  $p$ , the following are well-formed formulae:  $p \vee \neg p$  and  $\neg(p \vee \neg p)$ . Let  $A$  be the former and  $B$  be the latter. By hypothesis,  $A \rightarrow B$  is an axiom. We now derive  $\perp$  using this.

- |    |   |                |
|----|---|----------------|
| 1. | $p \vee \neg p \rightarrow \neg(p \vee \neg p)$ | Axiom          |
| 2. | $p \vee \neg p$                                 | LEM            |
| 3. | $\neg(p \vee \neg p)$                           | MP 1, 2        |
| 4. | $\perp$   | $\perp$ i 2, 3 |

Thus, by definition,  $\mathcal{P}$  is inconsistent.

---

2. (a)

(i) To show that  $\mathcal{A} = \{\neg, \wedge\}$  is an adequate set of formulae.

Note that  $A \vee B \equiv \neg(\neg A \wedge \neg B)$ . Thus, we can construct  $\vee$  using  $\mathcal{A}$ .

Also,  $A \rightarrow B \equiv \neg A \vee B$ .

As we had already constructed  $\vee$  using  $\mathcal{A}$ , we are done.

(ii) To show that  $\mathcal{B} = \{\neg, \rightarrow\}$  is an adequate set of formulae.

Note that  $A \vee B \equiv \neg A \rightarrow B$ . Thus, we can construct  $\vee$  using  $\mathcal{B}$ .

Also,  $A \wedge B \equiv \neg(\neg A \vee \neg B)$ .

As we had already constructed  $\vee$  using  $\mathcal{B}$ , we are done.

(iii) To show that  $\mathcal{C} = \{\rightarrow, \perp\}$  is an adequate set of formulae.

Note that  $\neg A \equiv A \rightarrow \perp$ . Thus, we can construct  $\neg$  using  $\mathcal{C}$ .

The result now follows from what we proved earlier as we can construct everything else using  $\perp$  and  $\neg$ .

2. (b)

We shall prove the statement by way of contradiction. Suppose not. That is,  $C$  is adequate and  $\neg \notin C$  and  $\perp \notin C$ .

Let us look at the set of all formulae  $S$  that contain only  $a$  as a propositional atom and connectives from  $C$ . By hypothesis,  $C$  is adequate, that is, for every formula, there is an equivalent formula with only connectives from  $C$ . In particular, an equivalent of the formula  $\neg a$  should be in  $S$ . Note that  $\neg a$  evaluates to  $F$  whenever  $a$  is  $T$ .

**Claim:** Given any formula  $\varphi \in S$ , it must evaluate to  $T$  whenever  $a$  is  $T$ . This will show that  $C$  is not adequate (as it could not possibly have  $\neg a$ ) and complete our proof.

*Proof.* We shall prove this by inducting on the number  $n$  of connectives in  $\varphi$ .

Base case.  $n = 0$ . The only such formula is  $\varphi = a$ . For this, the claim holds trivially.

Inductive hypothesis. Given a formula  $\varphi$  such that it has  $n$  or fewer connectives,  $\varphi$  evaluates to  $T$  when  $a$  is  $T$ .

Inductive step. Suppose  $\varphi$  is a formula with  $n + 1$  connectives. Then,  $\varphi$  can be written as  $\varphi_1 \circ \varphi_2$  where  $\circ$  is some connective from  $C$  and  $\varphi_1, \varphi_2$  are formulae in  $S$  with at most  $n$  connectives. By inductive hypothesis,  $\varphi_1$  and  $\varphi_2$  both evaluate to  $T$  whenever  $a$  is  $T$ . Let us now consider the following partial truth table.

$a$	$\varphi_1$	$\varphi_2$	$\varphi_1 \wedge \varphi_2$	$\varphi_1 \vee \varphi_2$	$\varphi_1 \rightarrow \varphi_2$	$\varphi_2 \rightarrow \varphi_1$
$T$	$T$	$T$	$T$	$T$	$T$	$T$

Thus, it is clear that no matter what  $\circ$  is,  $\varphi$  will always evaluate to  $T$  whenever  $a$  is  $T$ .

This completes our proof of the claim, which in turns completes the complete proof.

3. We show that  $\{\downarrow\}$  is adequate by observing the following:

1.  $\neg A \equiv A \downarrow A$
2.  $A \wedge B \equiv \neg(A \downarrow B)$
3.  $A \vee B \equiv \neg(\neg A \wedge \neg B)$

Hence, proved.

---

4. We show that  $\{\oplus\}$  is not adequate by way of contradiction. Assume that  $\{\oplus\}$  were adequate. Then, we should have been able to write  $A \wedge B$  in terms of  $A, B$  and  $\oplus$ . We show that this is not possible using the following claim.

**Claim:** Let  $\varphi$  be any formula made using  $A, B$  and  $\oplus$ . Then, the truth table of  $\varphi$  has an even number of  $T$ s.

*Proof.* We prove the claim using induction. We shall induct on the number  $n$  of  $\oplus$ s in the formula.

Base case.  $n = 0$ . The only such formulae are  $A$  and  $B$ .

$A$	$B$	$A$	$B$
$F$	$F$	$F$	$F$
$F$	$T$	$F$	$T$
$T$	$F$	$T$	$F$
$T$	$T$	$T$	$T$

Thus, we have proven the base case.

Inductive hypothesis. Let  $\varphi$  be any formula using  $A, B$  and at most  $n$   $\oplus$ s. Then,  $\varphi$  has an even number of  $T$ s in its truth table.

Inductive step. Let  $\varphi$  be a formula with  $n + 1$   $\oplus$ s. As  $\varphi$  is built using only  $\oplus$ s, we can write  $\varphi$  as  $\varphi_1 \oplus \varphi_2$  for some formulae  $\varphi_1$  and  $\varphi_2$  which have at most  $n$   $\oplus$ s. By induction hypothesis,  $\varphi_1$  has  $2a$   $T$ s in its truth table and  $\varphi_2$  has  $2b$   $T$ s for some integers  $a$  and  $b$ .

Let  $i$  denote the number of lines in which a  $T$  of  $\varphi_1$  is paired with an  $F$  of  $\varphi_2$  and let  $j$  denote the number of lines in which an  $F$  of  $\varphi_1$  is paired with a  $T$  of  $\varphi_2$ . Then,  $i + j$  is the total number of  $T$ s in the truth table of  $\varphi$ . Now note that the remaining  $(2a - i)$   $T$ s of  $\varphi_1$  were paired with the remaining  $(2b - j)$   $T$ s of  $\varphi_2$ . Thus,  $2a - i = 2b - j$ . Simple algebra gives us that  $i + j = 2(a - b + j)$ , which is even, as desired.

This proves our claim.

The claim then completes the proof as  $A \wedge B$  has an odd number of  $T$  in its truth table and therefore, cannot possibly be written using just  $\oplus$ .

---

5. First we show that consistency implies satisfiability.

If  $\mathcal{F}$  is consistent, then  $\mathcal{F} \not\vdash \perp$ , by definition.

As propositional logic is sound and complete, this means that  $\mathcal{F} \not\models \perp$ .

What the above means is that there is an assignment  $\alpha$  such that  $\alpha \models \mathcal{F}$  and  $\alpha \not\models \perp$ . The latter is always true anyway but the existence of an  $\alpha$  such that  $\alpha \models \mathcal{F}$  shows that  $\mathcal{F}$  is satisfiable.

Conversely, assume that  $\mathcal{F}$  is satisfiable. Then there exists an assignment  $\alpha$  such that  $\alpha \models \mathcal{F}$ , by definition. As  $\perp$  is never true,  $\alpha \not\models \perp$ . Thus, we have it that  $\mathcal{F} \not\models \perp$ . (Since there exists at least one assignment such that  $\mathcal{F}$  is true but  $\perp$  is not.)

As propositional logic is sound and complete,  $\mathcal{F} \not\vdash \perp$ .

Thus,  $\mathcal{F}$  is consistent, by definition.

---

6. (b) We are given that  $\mathcal{F} \vdash \perp$ .

(Definition of inconsistency.)

Also,  $\mathcal{F} = \mathcal{F}_G \cup \{G\}$ . Thus,  $\mathcal{F}_G, G \vdash \perp$ .

The above is the same as  $\mathcal{F}_G \vdash G \rightarrow \perp$ .

(Done in class.)

As  $G \rightarrow \perp \equiv \neg G$ , we get that  $\mathcal{F}_G \vdash \neg G$ .
